Drone Operations Management Training Course

21 – 25 February 2027
Istanbul (Turkey)

Drone Operations Management Training Course

Ref: 84_363205 **Date:** 21 – 25 February 2027 **Location:** Istanbul (Turkey) **Fees:** 4900 GBP

Introduction:

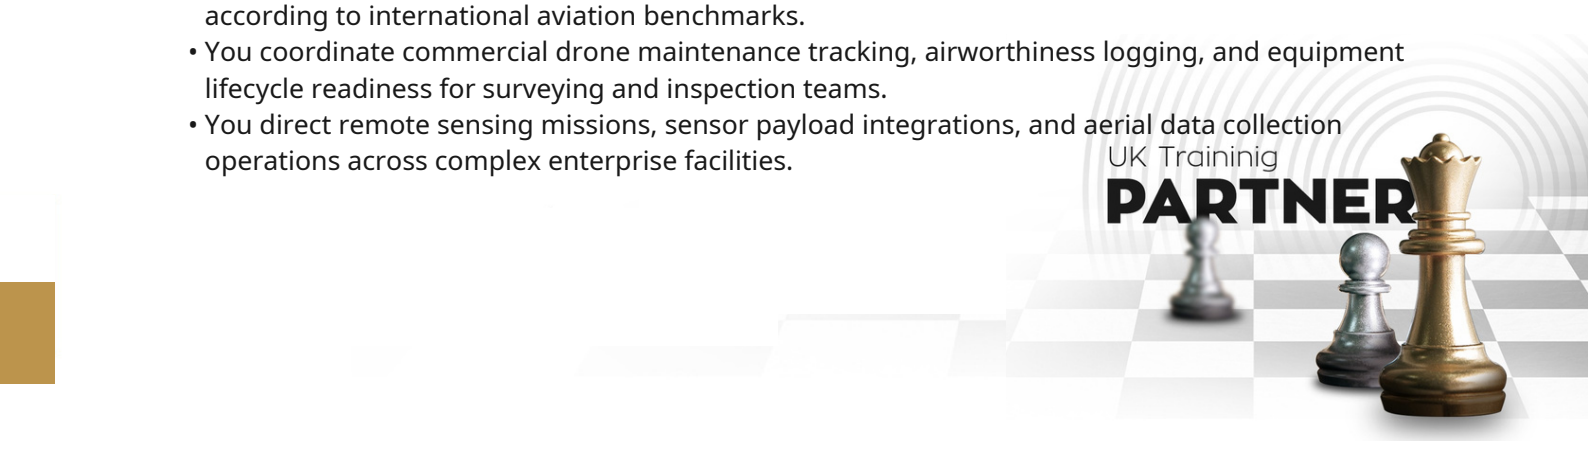

This Drone Operations Management Training Course enables you to direct commercial unmanned aircraft operations, regulatory compliance, and multi-rotor fleet safety across one week. You will build an Organisational Drone Operations Manual and Flight Safety Dossier containing standard operating procedures, operational risk assessments, airworthiness maintenance schedules, and emergency response plans. You need prior exposure to aviation concepts, site supervision, or technical facility management, as this practitioner-level course addresses operational workflows and safety systems. You will practise through operational simulation, responding to airspace conflicts, telemetry failures, and emergency fail-safes under realistic operational constraints.

Course Objectives:

- Draft standardised operational flight procedures using the ISO 21384-3 framework for commercial multi-rotor and fixed-wing mission logs.
- Map ground and air risk profiles using formal Operational Risk Assessment matrices for Specific category flights near critical infrastructure.
- Score remote pilot competencies and syllabus requirements using the ISO 23665:2021 Knowledge-Skill-Attitude criteria for organisational flight crews.
- Run airworthiness tracking and component lifecycle inspections using preventative maintenance schedules for commercial unmanned aircraft fleets.
- Test direct and network remote identification feeds using ISO 23629-8 protocols for integrated digital geo-awareness buffer zones.
- Present emergency contingency workflows using standard fail-safe return-to-home parameters for mission corridor operations.

Target Audience:

- You oversee enterprise drone flight operations, pilot scheduling, and mission authorizations across industrial infrastructure and construction sites.
- You supervise UAS safety compliance, incident reporting, and aviation regulatory submissions for organizational fleet deployments.
- You manage remote pilot flight crews, competency evaluations, and training syllabus adherence according to international aviation benchmarks.
- You coordinate commercial drone maintenance tracking, airworthiness logging, and equipment lifecycle readiness for surveying and inspection teams.
- You direct remote sensing missions, sensor payload integrations, and aerial data collection operations across complex enterprise facilities.

Course Outline:

Day 1: Establishing Drone Operational Governance and Airspace Compliance

- Evaluating regulatory operating categories using international unmanned aviation baselines
- Classifying drone mass thresholds using digital civil registry platforms
- Mapping aerodrome boundary standoff limits using aeronautical charting tools
- Documenting multi-agency import clearances using cross-border customs authorisation workflows
- Build: Regulatory Applicability Matrix and Airspace Standoff Protocol

Day 2: Implementing Operational Procedures and Quality Standards

- Aligning operational flight procedures using the ISO 21384-3 standard
- Designing remote pilot training syllabi using ISO 23665:2021 competency criteria
- Integrating direct remote identification systems using ISO 23629-8 protocols
- Benchmarking flight crew competency criteria using ASTM F3266 guidelines
- Build: ISO-Compliant Flight Operations Manual and Competency Matrix

Day 3: Managing Fleet Airworthiness and Mission Dispatch Workflows

- Scheduling preventative maintenance routines using digital airworthiness logbooks
- Verifying pre-flight inspection steps using multi-rotor deployment checklists
- Tracking propulsion and battery lifecycles using component telemetry logs
- Dispatching visual line of sight missions using pre-flight briefing forms
- Build: Fleet Airworthiness Schedule and Flight Dispatch Checklist

Day 4: Mitigating Operational Hazards and Managing Emergencies

- Evaluating ground and air risks using formal Operational Risk Assessment templates
- Formulating Beyond Visual Line of Sight mitigations using operational containment buffers
- Configuring lost-link recovery routines using automated fail-safe return-to-home settings
- Investigating UAS telemetry deviations using root cause analysis logs
- Build: Operational Risk Assessment and Flight Emergency Matrix

Day 5: Executing Drone Operations in Mission Simulation Scenarios

- Resolving unexpected airspace incursions using Day 1 standoff protocols
- Simulating pilot communication handovers using Day 2 competency workflows
- Responding to live battery degradation alarms using Day 3 maintenance logs
- Managing telemetry signal loss scenarios using Day 4 emergency containment trees
- Build: Organisational Drone Operations Manual and Flight Safety Dossier

Skills You Will Gain:

- ISO 21384-3 Operations Manual Formulation
- ISO 23665:2021 Syllabus Architecture Design
- ISO 23629-8 Direct Remote Identification Integration
- Preventive Airworthiness Log Tracking
- Digital Mission Dispatch Verification
- Aeronautical Standoff Buffer Analysis
- Automated Fail-Safe Recovery Parameterisation

Why Attend This Course:

- Establish organizational flight procedures according to ISO 21384-3 operational standards to maintain consistent multi-crew flight discipline.
- Assess airspace restrictions and standoff perimeters around sensitive infrastructure using aeronautical charts and digital geo-awareness parameters.
- Manage fleet maintenance cycles and component life limits using structured airworthiness logs to prevent equipment breakdowns during field deployments.
- Assemble an Organisational Drone Operations Manual and Flight Safety Dossier to formalise mission authorisations, risk assessments, and incident response trees across your enterprise.

Conclusion:

Returning to your desk, you will open your Organisational Drone Operations Manual and Flight Safety Dossier to calibrate internal flight authorisations and fleet maintenance logs against international operating standards. You will present the completed operational risk matrices, pilot competency checklists, and emergency containment workflows to your operations director and chief remote pilot for formal organisational validation. Following its initial deployment during active field missions, you will check pilot logbook entries, component inspection records, and fail-safe verification sign-offs to confirm total procedural adherence across all operating crews.

Frequently Asked Questions FAQ:

What will you be able to do after the Drone Operations Management Training Course?

You will be able to manage commercial drone fleets, lead flight crew operations, establish ISO 21384-3 compliant operating procedures, evaluate mission risks, and direct emergency containment responses. You will also oversee preventative airworthiness schedules and align multi-rotor missions with international aviation safety requirements.

What do you need to know before starting the Drone Operations Management Training Course?

You need practical familiarity with commercial UAS hardware, site supervision, or technical aviation operations. Prior experience reviewing operational checklists or coordinating field data collection is advantageous, as this practitioner-level course explores structured flight governance, safety management frameworks, and organisational compliance rather than rudimentary flight stick mechanics.

What do you build during the Drone Operations Management Training Course?

You build an Organisational Drone Operations Manual and Flight Safety Dossier. This package incorporates standard operating procedures, flight crew competency matrices, preventative airworthiness maintenance schedules, formal operational risk assessments, digital geo-awareness buffer protocols, and incident escalation trees for enterprise drone deployments.

How does the Drone Operations Management Training Course differ from a basic remote pilot licensing course?

This course concentrates on organisational fleet oversight, airworthiness systems, and flight risk governance rather than individual pilot stick-handling or basic licensing exam prep. You develop enterprise-level management systems, mission dispatch workflows, and ISO-aligned operational manuals required to lead multi-crew commercial drone programmes safely.
